Introduction

University Space Engineering Consortium (UNISEC) has compiled a report on the current state of "Report on Japanese University Rocket Projects" in October 2012. The latest version of report will be also been made available on the Internet at the UNISEC web site.

http://www.unisec.jp/member/jusat-e.html

In response to requests, the UNISEC continues this activity and will publish a revised and updated edition of the above directory in the future.

We hope this report can support professionals and students who are interested in Space Engineering Education in Japanese Universities.

Comments, queries and information with respect to this report are most welcome.

Keywords
Hybrid Rocket, Launch, Combustion, Space Education

[1] Overview and Science Highlights of the project
1. Application of low melting point thermoplastics to hybrid rocket fuel
2. Development of a small sounding hybrid rocket
3. Application of small hybrid rocket to science and engineering education with experience of project execution for university student

Launch site information
1. Noshiro space park (Asanai 3rd Kousai Taiseki-jyo in Akita prefecture)
   Rockets launch and recover from ground and maximum altitude is 500m.
2. Used place of swimming area in Ochiai, Noshiro city, Akita prefecture
   Rockets launch from the beach and recover from sea and maximum altitude is a several ten km high.

Fig.1 Noshiro space park         Fig.2 Sea launch place

CAMUI-type Hybrid rocket, Solar orbit transfer vehicle, Liquid droplet radiator, Pulse detonation engine

[1] Overview and Science Highlights of the project

A mission of a rocket is to accelerate payloads such as satellites. Recently, a demand of the launch of micro satellite is drastically increasing. However, there is no small launcher provided for the launch of micro satellites because miniaturizing liquid rocket is difficult and solid rockets using explosives result in high launch cost.

Using CAMUI type hybrid rocket, we develop a small launch system of safe and low cost for micro satellites, and develop a new market of small-scale space utilization.

Milestones to the space;
- Launch into 60 km altitude to sample the stratospheric air.
- Launch into 100 km altitude to provide micro gravity environments.

[2] Achievements in Space Engineering Education through Rocket Activities (or Plan)

We have been getting to original rocket project since 2008. The members of this project are first year master’s degree student in our laboratory. The purpose of this project is to develop an automatic return rocket system with the CAMUI hybrid rocket motor. This system will enable students who develop the CanSat to provide a tool of convenient launch experiment. As the second year of this project, we developed the 1.3-m-long CAMUI hybrid rocket. The rocket have an avionics system which can do wireless communications with ground-based station using the bluetooth technology. And we launched the rocket twice. For a propulsion system, we designed and produced the CAMUI hybrid rocket motor whose thrust level is 310 N. The avionics system is composed of a microcomputer, angular velocity sensors. The data of the sensors are transmitted to a personal computer on the ground by the bluetooth.

Hybrid Rocket, Wax Fuel

[1] Overview and Science Highlights of the project

The number of hybrid rocket launches is 27.
The hybrid rockets uses WAX fuel.
The parachute separation devise with no explosives is developed originally.
The maximum altitude is approximately 1km.
We launch hybrid rockets during spring and summer holidays.
Our launch sites are Noshiro in Akita or Taikicho in Hokkaido.

The 27th rocket was launched successfully in 19/2/2012.
[2] Achievements in Space Engineering Education through Rocket Activities (or Plan)

- We have student rocket project as an extracurricular class
- They conduct design, manufacture, experiments and launch of original hybrid rockets for themselves.
- Target is to learn expert knowledge, technical skill and teamwork.
- Members are about 50 students, from freshman to master’s degree course students.

Wakayama University has been working on setting up launch sites for student rocket projects in Japan. As a result, we have two “playgrounds” for rocket launches and balloon experiments: Kada (Wakayama pref.) and Izu-Oshima Island (Tokyo pref.). A launcher is also available at each site. Furthermore, rocket-engine tests (J-type) can be carried out in Wakayama univ. since 2012/04. So students can use well-equipped machine tools and measurement devices for their activities. These convenient sites and facilities are available for any student projects almost anytime. Please contact us, if you need them!

Three-teams are active in Wakayama univ., and collaborating each other.

1: Wakayama Space Project (WSP), Wakayama univ.

WSP is a student project which has two themes: hybrid-rocket and balloon-sat. This project isn’t based on any laboratories and any departments, therefore any grade/department of students can join this project.

2: Institute for Education on Space (IfES), Wakayama univ.

The IfES staffs design and implement various educational programs though rocket and other space activities. They use three types of rockets: hybrid-rockets, model-rockets, and paper-rockets. The staffs started to make a hybrid-rocket in 2012/04. The main purpose is making curriculums that assist the students and stuffs to become dependable people. A model-rocket (type-H) is dedicated to “Can-sat koshien”. This event gives an opportunity of space engineering to high school students. A paper-rocket, which is made by A4 papers and daily necessities, is easy to make even for elementary school student. So it is a good educational tool to learn a sense of safety and physics.
3: TOKAI - ROCKETEERS (TR)

The TR is a rocket team which consists of stuffs. The members have adequate experiences of rocket development. They can advise the WSP and the IfES members on technical matters.

These three-teams corporate each other on rocket-engine tests, rocket building, rocket launches, and any other experiments and measurements.

[2] Achievements in Space Engineering Education through Rocket Activities (or Plan)

As official educational program in Wakayama University, there has been student rocket project for any grade of students for half a year. Also, in the second half term of this year, project management course by utilizing hybrid rocket will start, and this is also for any grade/department of students.

As unofficial ones, “rocket girls and boys” and “Can-sat koshien” for high school students, as mentioned above, has been organized by Wakayama University too. A paper-rocket seminars are held for elementary, junior high school students and their teachers.
